## Fracture Mechanics - Workshop Solutions

1. Given: $\mathrm{W}=50 \mathrm{~mm} ., \mathrm{B}=25 \mathrm{~mm}, \mathrm{a}_{\mathrm{o}}=25 \mathrm{~mm}, \mathrm{P}=25 \mathrm{kN}$
a) $\mathrm{a} / \mathrm{W}=25 / 50=0.5$, then $\mathrm{f}=9.66$
from compact specimen $K$ calibration table in Lecture 2.1
$\mathrm{K}=\mathrm{Pf} / \mathrm{B} \sqrt{ } \mathrm{W}=(.025 \mathrm{MN})(9.66) /(.025 \mathrm{~m})(\sqrt{ } .05 \mathrm{~m})=43.2 \mathrm{MPa}^{\mathrm{m}}$

Let $\Delta \mathrm{a}=5 \mathrm{~mm}$ then $\mathrm{a}=30, \mathrm{a} / \mathrm{W}=0.6, \mathrm{f}=13.65$,
$K=(5)(13.65) /(1)(\sqrt{ } 2)=61.0$
b) Similar calibrations $\mathrm{a}=250, \mathrm{~W}=500, \mathrm{P}=80, \mathrm{~K}=43.7$
$\mathrm{a}=255, \mathrm{a} / \mathrm{W}=.51, \mathrm{f}=9.96, \mathrm{~K}=45.1$
c) CCT use 2.1 from Tada Handbook (in Section 2)
$\mathrm{a}=25, \mathrm{~b}(\mathrm{~W})=5.0=2 \mathrm{~W} / 2, \mathrm{a} / \mathrm{b}=0.2, \mathrm{~F}=1.0246 ;$
$\sigma=1.0 \mathrm{MN} /(.025 x .25) \mathrm{m}^{2}=160 \mathrm{MPa}$

ii) Initiation flaw, $\mathrm{a}=0.02,2 \mathrm{c}=0.1, \mathrm{a} / 2 \mathrm{c}=0.2, \mathrm{Q}=1.32$,
$K=1.122 \Delta \sigma \sqrt{ }(\pi \mathrm{a} / \mathrm{Q})$
If $\Delta \sigma=15, \Delta \mathrm{~K}=1.122(15) \sqrt{ }(0.02 \pi /(1.32)=3.7$ too low,
If $\Delta \sigma=27.4, \Delta \mathrm{~K}=6.1>6.0$ crack could begin to grow

Needs same high load
iii) In 7 years the devise could have $(7 \mathrm{yr}) \times(365$ day $) \times(12 \mathrm{hr}) \times(5$ lifts $)=150,000$ cycles

Do da/dN analysis using steel upper bound equations
Minimum life is 400,000 cycles
It would take a higher stress to shorten the life

Conclusion from this is that strut was consistently overloaded, about 140 kips instead of 75 kips the design load
$\mathrm{da} / \mathrm{dN}$ vs $\Delta \mathrm{K}$ analysis

Use generic steel upper bound CGR, $\mathrm{a}_{0}=0.02 \mathrm{in}$, $\mathrm{a}_{\mathrm{f}}=1.75 \mathrm{in}, \Delta \sigma=15 \mathrm{ksi}$

$$
\begin{aligned}
& \frac{d a}{d N}=6.6 \times 10^{-9} \Delta K^{2.25} \\
& \Delta K=1.122 \Delta \sigma \sqrt{\pi a}
\end{aligned}
$$

$$
\frac{d a}{d N}=6.6 \times 10^{-9}\left[1.122(15 \sqrt{\pi a}]^{2.25}=1.373 \times 10^{-5} a^{1.125}\right.
$$

$$
N_{f}=\int_{0.02}^{1.75} \frac{d a}{1.373 \times 10^{-5} a^{1.125}}=\frac{1}{1.373 \times 10^{-5}}\left[\frac{a^{-0.125}}{-0.125}\right]_{0.02}^{1.75}=408,000
$$

18. No solution here, open ended,

Look at:
i) Final crack size at beginning of dimples
ii) $\mathrm{K}_{\text {Iscc }}$ at beginning of intergranular surface
iii) Also try to match SS with some da/dN calculations
iv) Try to find the initiation site $\Delta \mathrm{K}_{\mathrm{TH}}$
